

# Is This Your Lawn?

## YOU HAVE CHAFER BEETLE LARVAE DAMAGE !

Adult European Chafers are tan or brown beetles resembling June beetles but measure only about 1.5cm in length. The grubs, measuring 2 to 2.5 cm, are soft, white, and C-shaped with tan-coloured heads and six prominent legs.

Because this invasive species reproduces rapidly and feeds on the roots of all kinds of plants, including grass and turf used for lawns, it has become a serious pest in the greater Vancouver and area.

## HOW CAN YOU REDUCE THIS DAMAGE?

- Keep your turf healthy.
- Adopt a vigorous maintenance routine involving aerating, de-thatching, fertilizing, deep watering, and mowing.
- **Call Terrastar Solutions today** and
- Reseed with **Marrakech High Endophyte Tall Fescue**

### Marrakech Endophyte Enhanced Tall Fescue

Has superior drought tolerance, shade resistance, traffic tolerance and disease resistance, however the best characteristic of Marrakech is the bugs don't like it!

### What do the experts say?

- Michigan State University "tall fescue appeared to be the most tolerant of grub feeding"
- University of Kentucky "tall fescue is generally more tolerant of grubs than perennial ryegrass"
- Oregon State University "endophyte infected tall fescue had greater resistance to herbivory by chafer"

### Why Terrastar Solutions Inc.

- 30 years in growing quality turf in British Columbia
- state of the art equipment
- polite and courteous crews
- fully insured, licensed and safety conscious
